#	Reference Story Number	Pool (Story Points, either 1, 2, 3, 5, 8, 13, or 21: corresponding to expected level of effort)	Story Source (Previous class, internship, project)	Story Summary
1		1	EECS 348 Assignment 7	Created a Use Case Diagram corresponding to a lab assignment about how a user interacts with a database.
2		1	EECS 581 Project 1	Created a function to display the Minesweeper board in the command line. The function goes through the board and displays each cell based on its current state, including covered, uncovered, flagged, or mine.
3		1	EECS 348 Lab 5	Created a UML Use Case Diagram for a cruise ticketing system. Defined different actors and their interactions with the system, including creating accounts, searching cruises, making reservations, processing payments, modifying reservations, cancellations, refunds, and check-in.
4		2	EECS 678 Signals Lab	Set up signal handling in C using sigaction for different signals including SIGINT, SIGTSTP, and SIGALRM. Added the required signal handlers and configured the signal mask to control which signals could be received.
5		2	EECS 658 Assignment 1	Loaded the Iris dataset and split the data into
6		2	EECS 140 Lab	Soldered electronic components onto a circuit board by following the provided circuit layout. Connected the required components in their correct locations and tested the completed board to make sure the connections were properly soldered and the circuit worked as expected.
7		3	EECS 581 Project 2	Read through pre-existing code and documentation to understand what was already accomplished.

#	Reference Story Number	Pool (Story Points, either 1, 2, 3, 5, 8, 13, or 21: corresponding to expected level of effort)	Story Source (Previous class, internship, project)	Story Summary
	8	3	EECS 268 Data Structures Lab	Implemented different data structures in C++ including linked lists. Created functions to insert, remove, search, and access elements while correctly managing the connections between nodes and testing the data structure with different inputs.
	9	3	EECS 388 Lab 8	Implemented timer interrupt handling on a RISC-V HiFive board to control alternating LEDs. Completed functions to enable and disable interrupts, configured the timer to generate interrupts every 100 milliseconds, and implemented the timer handler to track each interrupt.
	10	5	EECS 268 Lab 8	Created a hospital simulation using a list-based Max Heap to prioritize patients based on illness severity, age, and arrival order. Implemented operations to add patients, find the highest priority patient, treat and remove patients, and maintain the heap structure.
	11	5	EECS 268 lab 6	To create blob file(aka. node file with initiation of up, down, left, down). Create another file importing blob file checking any error and giving error messages. In the same file setup functions to check blob moving rules. Last, execution file(aka. main file) with both files imported and declared to run and ask an input file.
	12	5	EECS 140 lab 9	All of the 9 vhd files needed to create ALU were given. Task was to create toplevel vhd file. Then. declare, port mapping, contraints all of the 9 given files for use. Lastly, set control switches to see results of operations
	13	8	EECS 581 Project 2	Read through pre-existing code and documentation. Found bugs and compatability issue for different OS systems. Fixing existing UI bugs and implement for better visablity of revealed cells.

#	Reference Story Number	Pool (Story Points, either 1, 2, 3, 5, 8, 13, or 21: corresponding to expected level of effort)	Story Source (Previous class, internship, project)	Story Summary
	14	8	EECS 140 lab 6	Task 1: answer few questions about FPGA , VHDL, and seven segment display. Task 2: Create the truth table for the seven-segment display, including all results. Task 3: implement seven-segment program, architecture, the constraint file for 4 switches to control the input bits and 7 segments as well as anodes constraints to control 7_segment display. Task 4: report
	15	8	EECS 248 lab 9	To create max-heap list-based implementation. file 1: node of information of each patients with priority listed in a file. file 2: heapify file with functions needed to maintain max-heap. file 3: main execution file declaring other files and for hospital simulation with user input file. Main challenge is to keep the max heap in a list. Lots of temp variables those have to used and cleared before next use and order of the codes matters.
	16	13	EECS 140 lab 11	Task 1: Truth table for 3-to-8 Decoder and answer questions. Task 2: Create a new Vivado project and Implement the 3-to-8 Decoder onto Basys3 Board. Task 3: truth table for 8-to-3 Encoder. Task 4: Implement the 8-to-3 Encoder onto Basys3 Board. Task 5: report summary. Had to refer back to some of previous labs for help.
	17	13	EECS 565 mini project 1	Task 1: Vigenère Cipher program creation. Task 2: brute-force password cracker creation. For efficiency, brute force password cracker had changes into its algorithm where checking for specific first 4 letters. Task 3: Using brute-force password cracker to decrypt cipher and record the time. Task 4: report summary

#	Reference Story Number	Pool (Story Points, either 1, 2, 3, 5, 8, 13, or 21: corresponding to expected level of effort)	Story Source (Previous class, internship, project)	Story Summary
	18	13	EECS 565 mini project 2	Task 1: Encryption using different ciphers and modes of operations. Using different modes of same file to test differences between padding of different modes in Task 2. Task 3: Difference between Error Propagation – how corrupted cipher text results in different modes. Task 4: report of all the process with screenshots of the codes and results recorded. All core questions have to be answered using the knowledge of different modes and the result obtained from the proiect.
	19	21	Java + MySQL Project	Created a local instance of a MySQL database. Created the Model View Controller architecture of a Java program and integrated the local instance of SQL. Staged the database with dummy data. The user interacted with the database via the created Java program to create, read, update, and delete information, as well as communicate with different users via a mock "email" service.
	20	21	EECS 388 lab 10	Arduino project designed for two people done it by myself. Task 1: implement a prototype automatic braking system using the TFmini lidar sensor from Lab 04. Task 2: implement auto_brake() with LED Breaking Indicator. The LED will flash green, yellow, or red depending on the distance receiving from the sensor. Task 3: angle values set for steering wheel. Task 4: After successfully extracting the angle value, you must then pass it to the steering() function, which will turn the servo motor.

#	Reference Story Number	Pool (Story Points, either 1, 2, 3, 5, 8, 13, or 21: corresponding to expected level of effort)	Story Source (Previous class, internship, project)	Story Summary
	21	21	EECS 510 Final Project	Designed and implemented a formal language called Corner Kick Play Language (CKPL) to represent soccer corner-kick plays. Defined its alphabet, semantics, and grammar, created a DFA to recognize valid strings, implemented the automaton using Python data structures, and developed a testing function to accept or reject inputs.
